As for the problems and difficulties our group had during the project, there were five main areas that we could have performed better at. The first one was planning. Often times our planning wasn't as in-depth as it should have been, so there was definitely room for improvement there. Another area is organization. We definitely could have been better organized throughout the semester. A couple times it seemed like everyone just went their own ways doing their own thing, so we could have organized our efforts a bit more like a cohesive team. We also could have improved the way we resolved internal conflicts in a way that wouldn't alienate group members and divide the group. Github was another thing we could have improved our use of. We really didn't know how to properly sync and merge branches in the way we were supposed to, resulting in accidental overwriting of files and merge conflicts being a common occurrence. Finally, the majority of our group was inexperienced in the development and use of databases, so only one person in our group could develop our database, which hampered development speed.
